

# Improving Interactions with Healthcare Robots:

## The Effect of Attention, Humour, and Empathy Behaviours by a Healthcare Robot on User Perceptions and Behaviours

**Dr. Deborah Johanson**

Dr. Ho Seok Ahn, Dr. Bruce MacDonald, Byeong Kyu Ahn, Jong Yoon Lim,  
Christopher Lee, Eddie Hwang, Rishab Goswami, Kazuki Saegusa,  
and Dr. Elizabeth Broadbent

## What are Healthcare Robots?

Designed with the goal of enhancing or maintaining the health and quality of life of the human user (Broadbent et al, 2009).

Broadbent, E., Stafford, R., & MacDonald, B. (2009). Acceptance of healthcare robots for the older populations: review and future directions. *International Journal of Social Robotics*, 1(319), 319-330.

## Rationale

- Healthcare robots interact with potentially vulnerable individuals
- Ethical responsibility to ensure appropriate healthcare robot behaviour

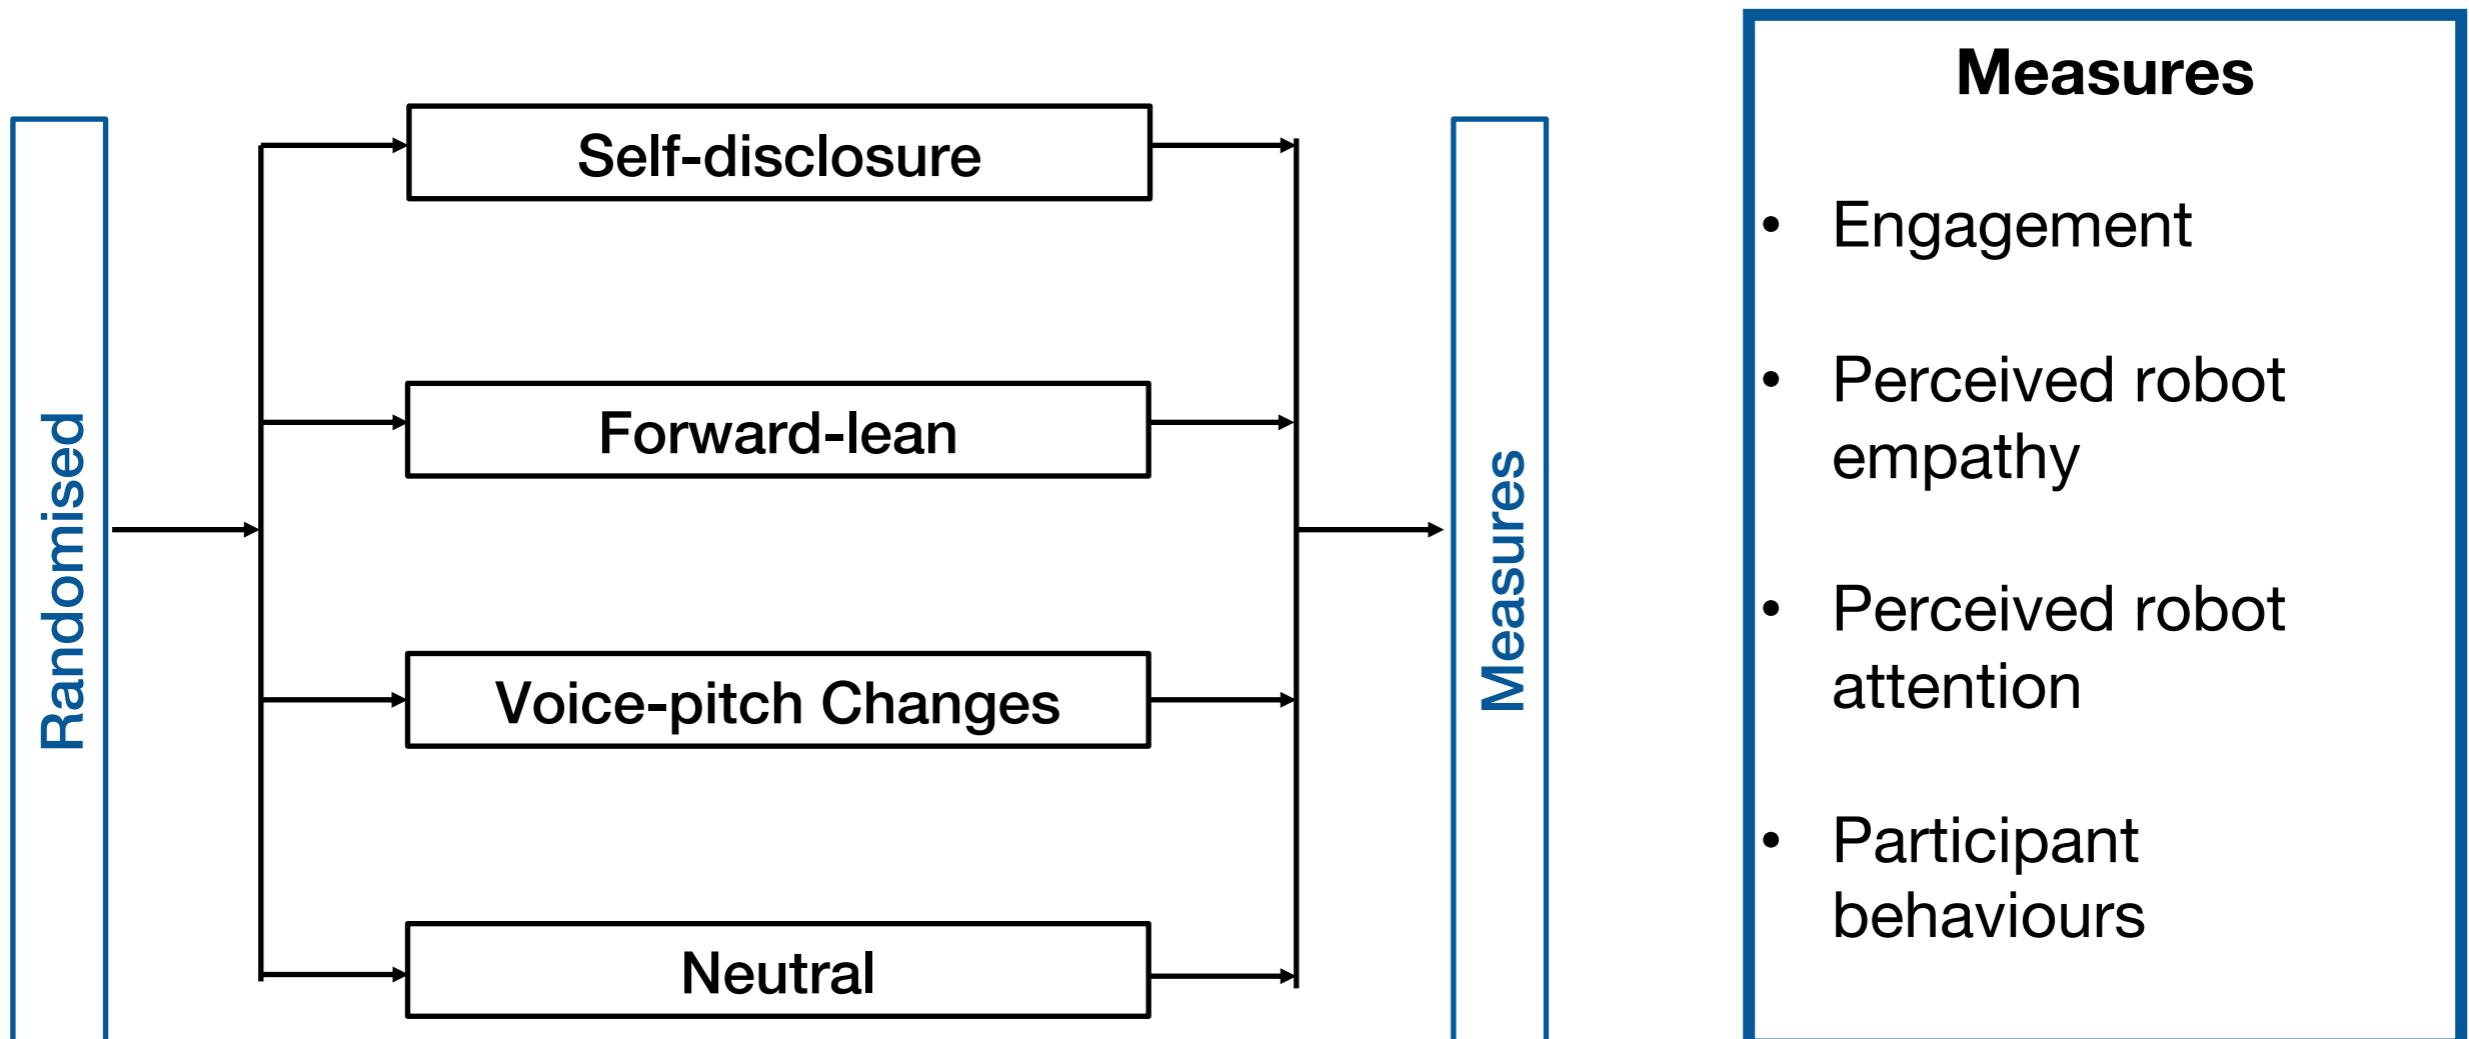

## Study 1

**Aim:** To investigate the effect of a healthcare receptionist robot using attentional behaviours (self-disclosure, voice-pitch changes, and forward-lean) on participant perceptions and behaviour

Johanson, D. L., Ahn, H. S., MacDonald, B. A., Ahn, B. K., Lim, J., Hwang, E., Sutherland, C. J., & Broadbent, E. (2019). The effect of robot attentional behaviours on user perceptions and behaviours in a simulated healthcare interaction: Randomized controlled trial. *Journal of Medical Internet Research*, 4(21): e13667.  
<https://doi.org/10.2196/13667>

# Study 1- Method (N=181)

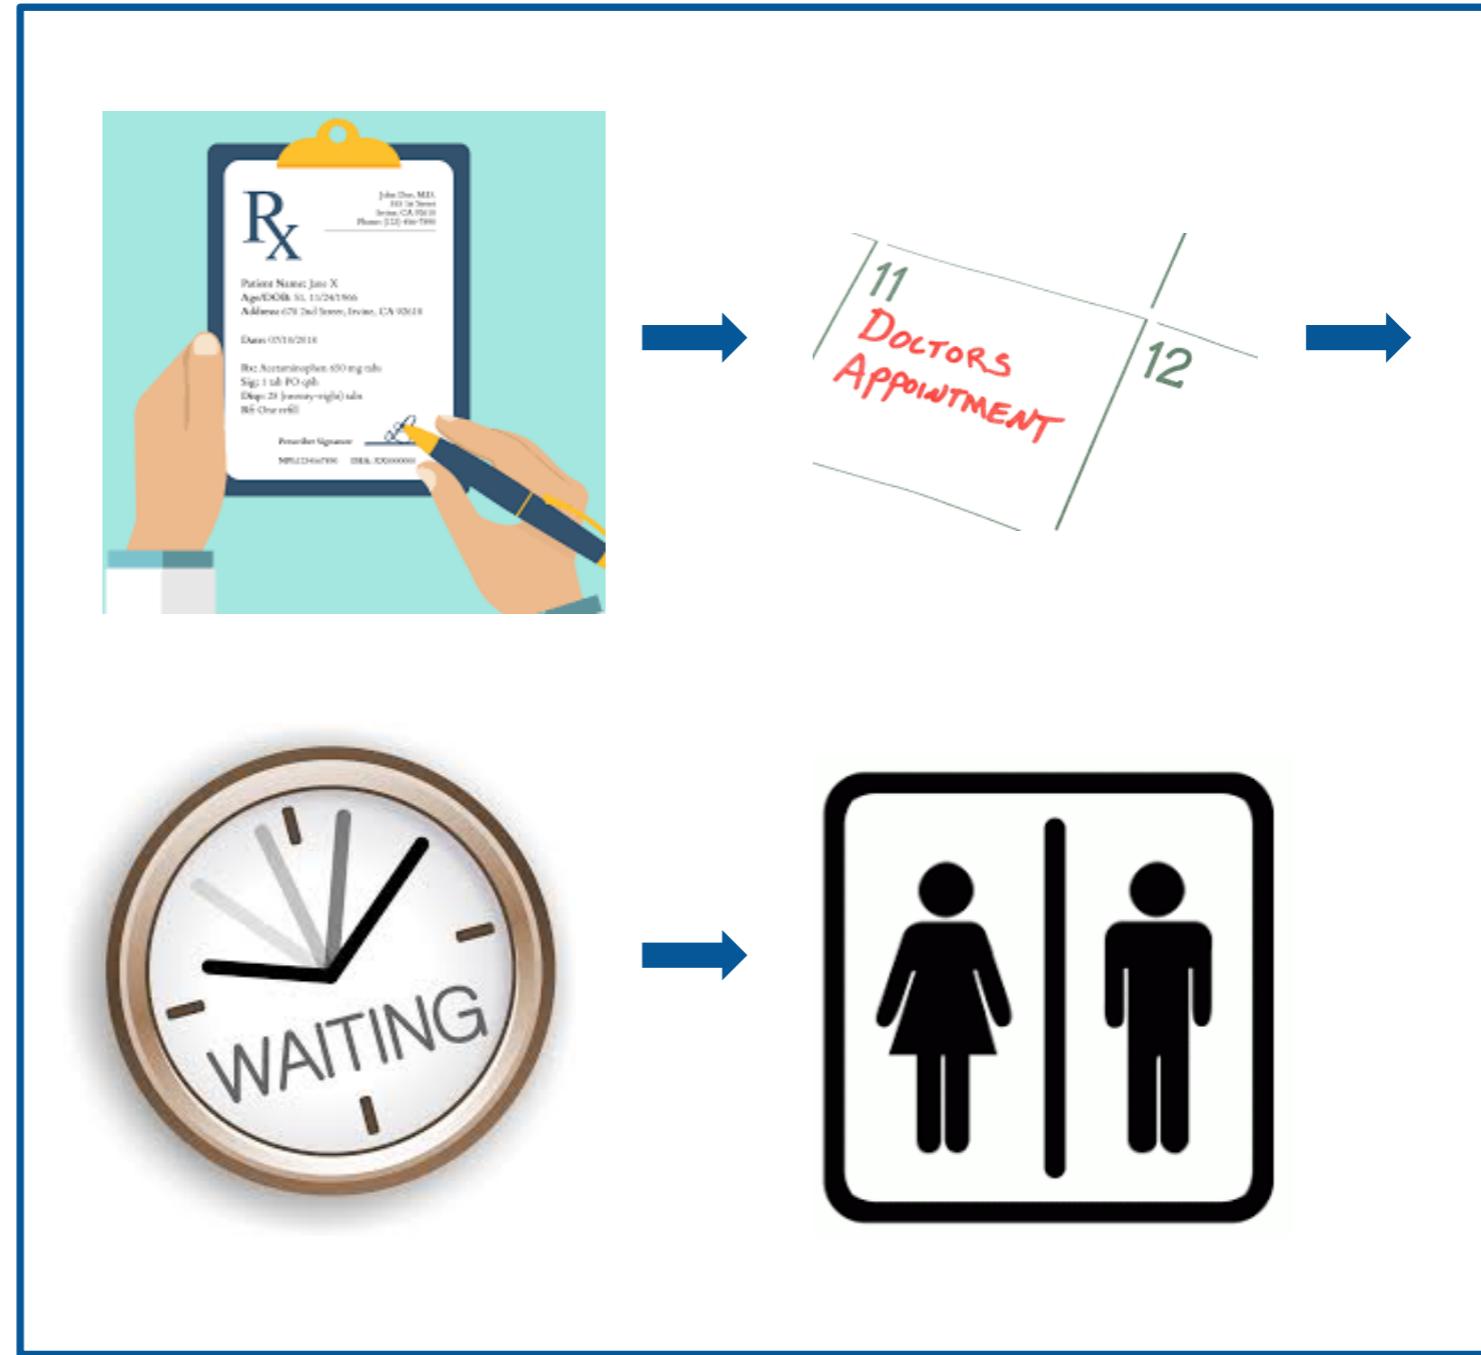

## Study 1 - Procedure

- Autonomous
- Scenario
- Scripted

## Study 1- Key Findings

- Self-report measures: No significant differences between groups in regards to engagement, perceived robot empathy, or perceived robot attention.
- Individual Engagement Items - Significantly more boring and unstimulating when using voice pitch changes
- Potential explanation - Vast majority (148/181) of participants never interacted with robot in the past:

Lack of comparison due to use of between subjects design

Novelty effects – participant engagement and perceived robot attention positively skewed

# Study 1- Key Findings

- Participant behaviours – significant difference between groups
- Forward lean and Self-disclosure groups – increased eye gaze behaviours
- Forward lean group – demonstrating forward lean behaviours towards the robot

- Self-disclosure – significantly difference in laughing behaviours
- ?Humour

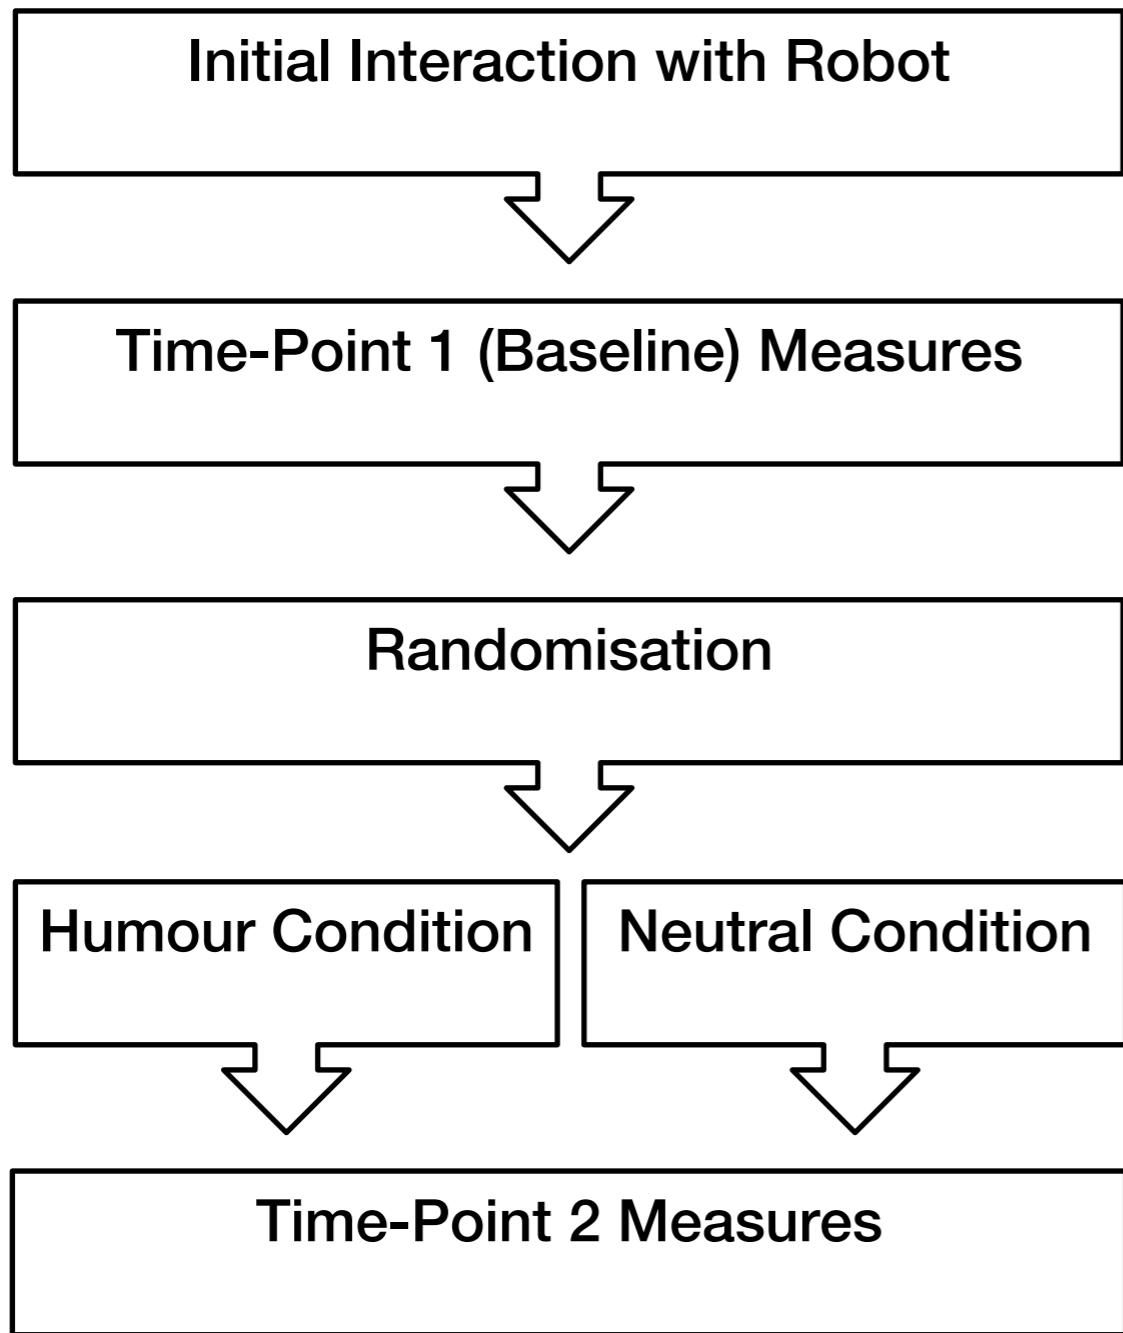

## Study 2

**Aim:** To investigate the effect of a healthcare nurse robot using humour on participant perceptions and behaviour

Johanson, D. L., Ahn, H. S., Lim, J., Lee, C., Sebaratnam, G., MacDonald, B. A., & Broadbent, E. (2020). Use of humour by a healthcare robot positively affects user perceptions and behaviour. *Technology, Mind, and Behaviour*, 1 (2). <https://doi.org/10.1037/tmb0000021>.

## Study 2 - Method (N= 91)

### Measures

- Intelligence
- Likeability
- Animacy
- Anthropomorphism
- Safety
- Empathy
- Personality
- Participant behaviour

## Study 2 - Procedure

- Autonomous
- Scenario
- Scripted

*DOCTORS APPOINTMENT*  
12

**PREVENT THE SPREAD OF THE FLU**

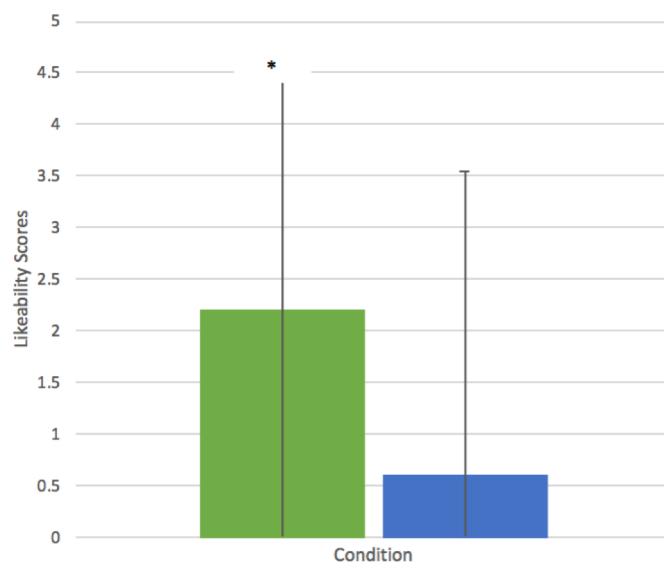

Besides getting vaccinated, the CDC recommends taking these steps:

 <p>■ Avoid contact with sick people.</p>	 <p>■ If you have flu-like symptoms, stay home until 24 hours after the symptoms disappear.</p>	 <p>■ Disinfect surfaces and wash your hands often with soap and water.</p>	 <p>■ Avoid touching your eyes, nose and mouth, as germs spread faster that way.</p>	 <p>■ INSTEAD, cover your mouth and nose with a tissue when you cough or sneeze, then throw the tissue away.</p>

*"I caught a computer virus once at it was terrible...that'll teach me to use a strange computers flash drive"*

## Study 2 - Key Findings

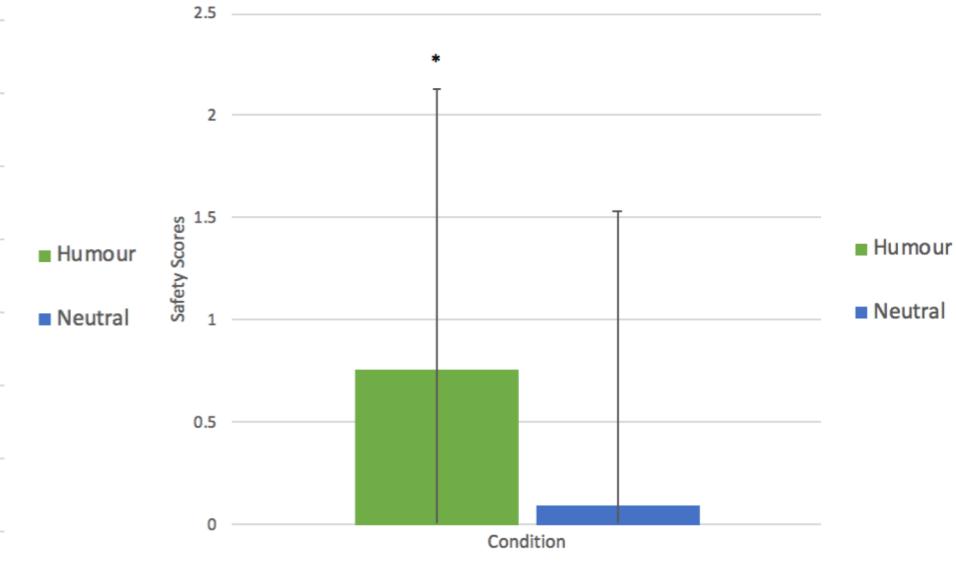

- Significant positive effects of humour on participant perceptions

**Likeability**

**Empathy**

**Safety**

- Animacy – lower animacy scores at time point one
- Personality items – happy, humorous, sociable, talkative, warm, popular, and imaginative....frivolous
- Significant differences in participant laughing behaviours

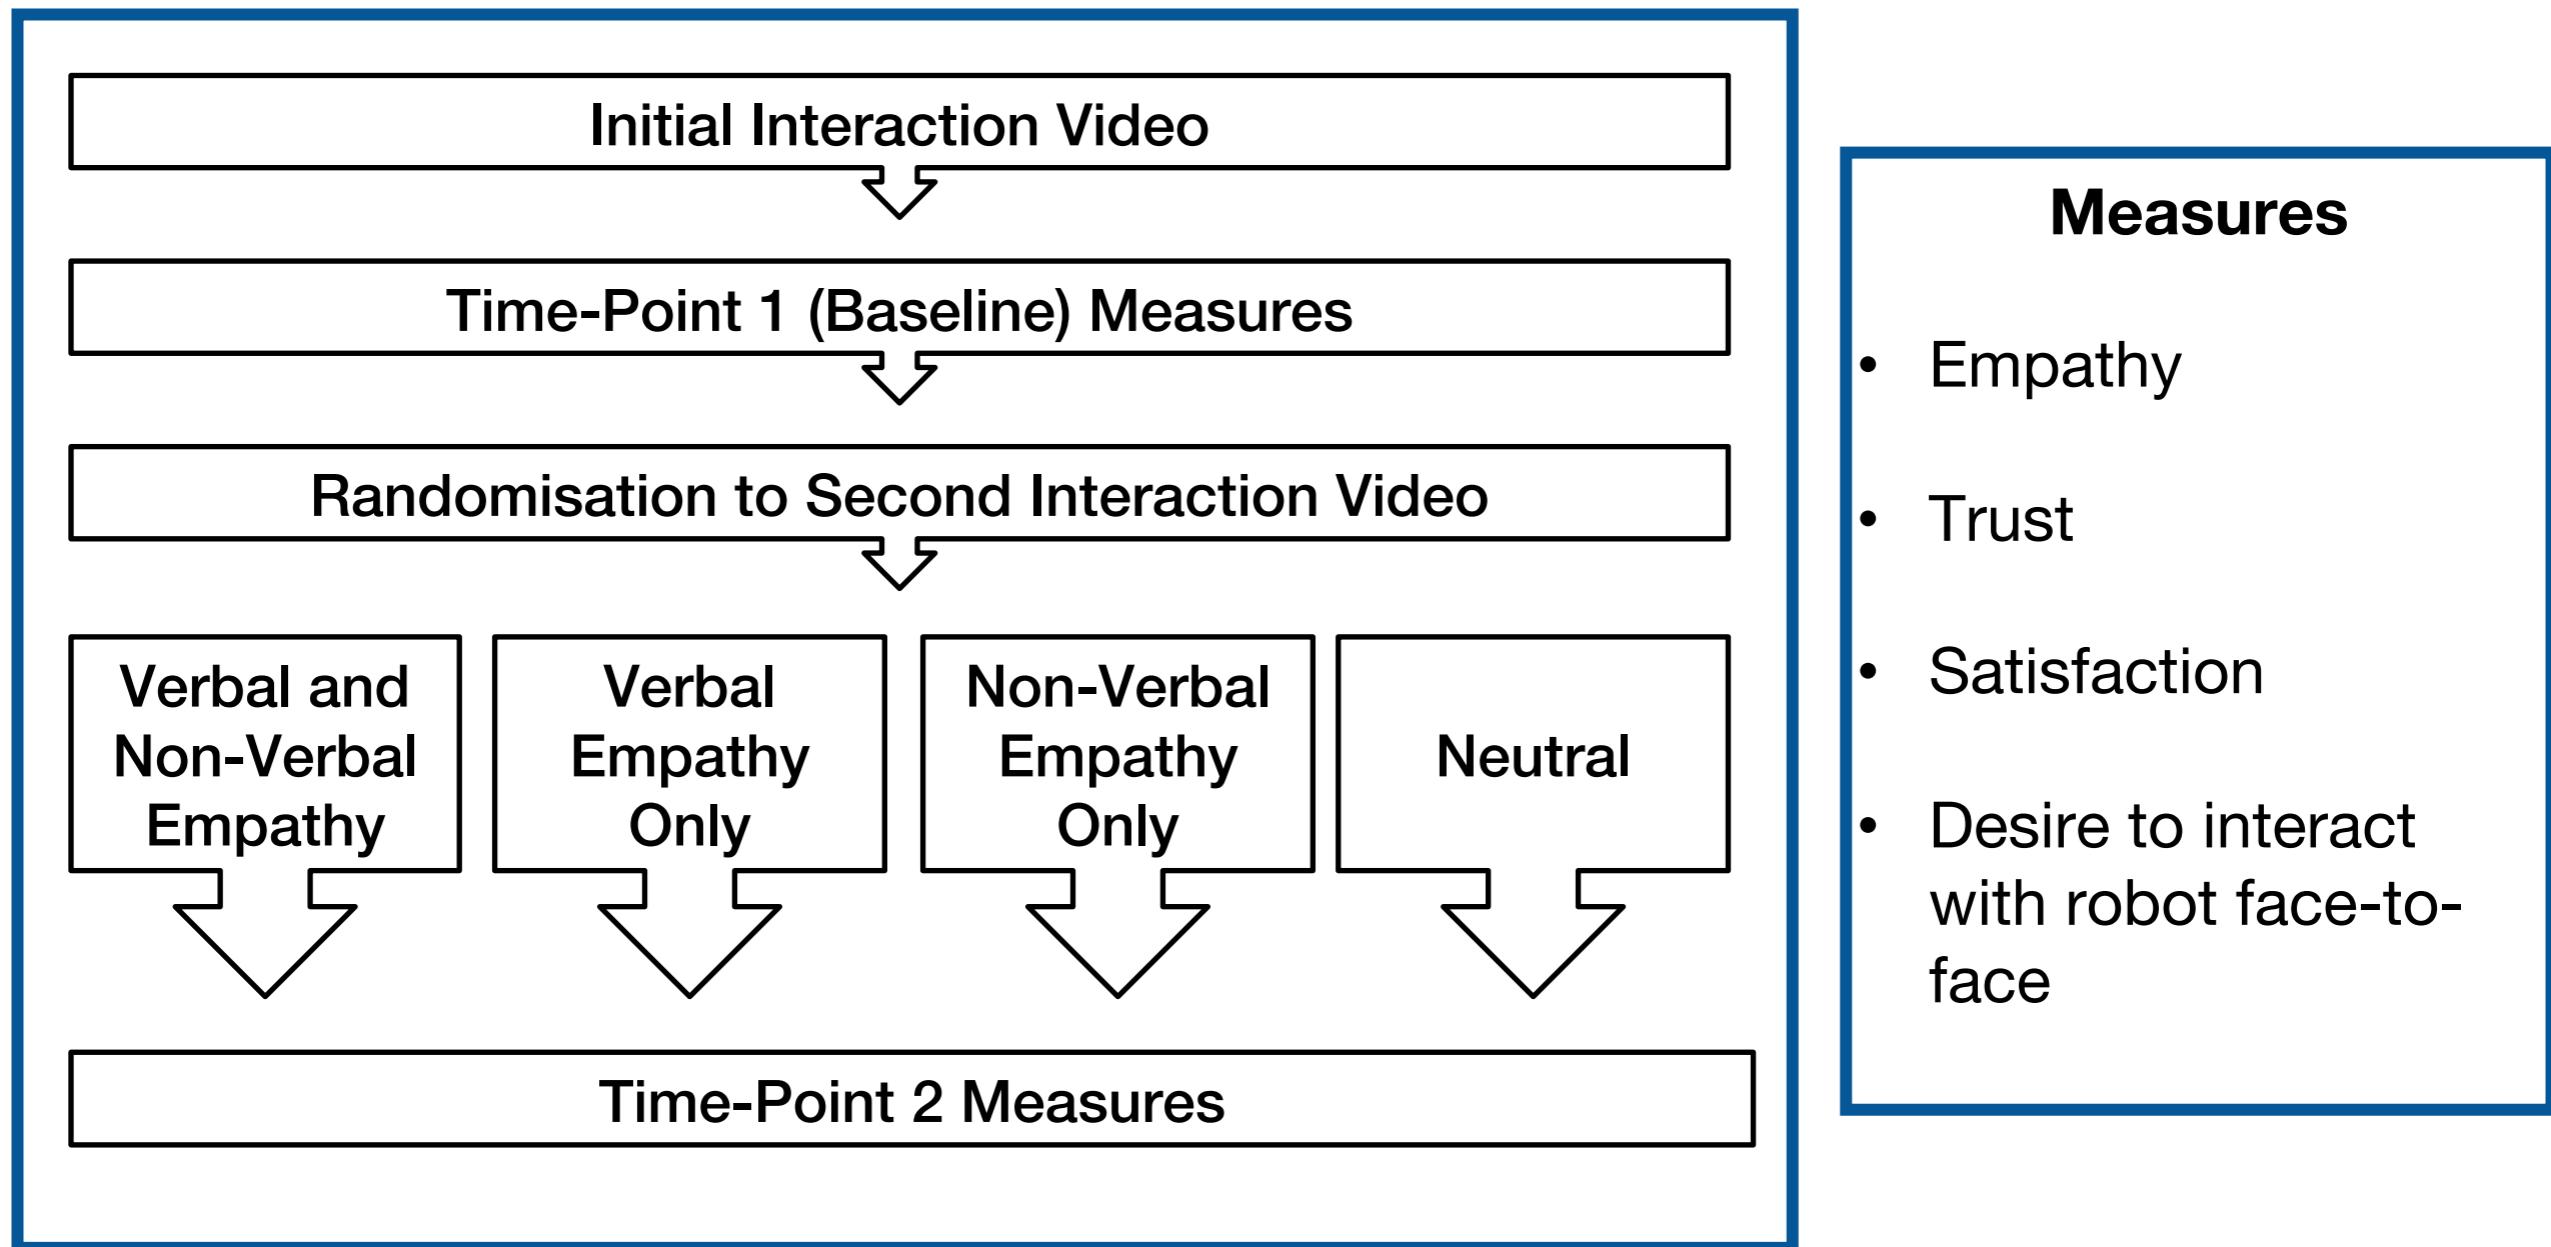

## Study 3

**Aim:** To investigate the effect of a healthcare nurse robot using verbal and non-verbal clinical empathy behaviours on participant perceptions

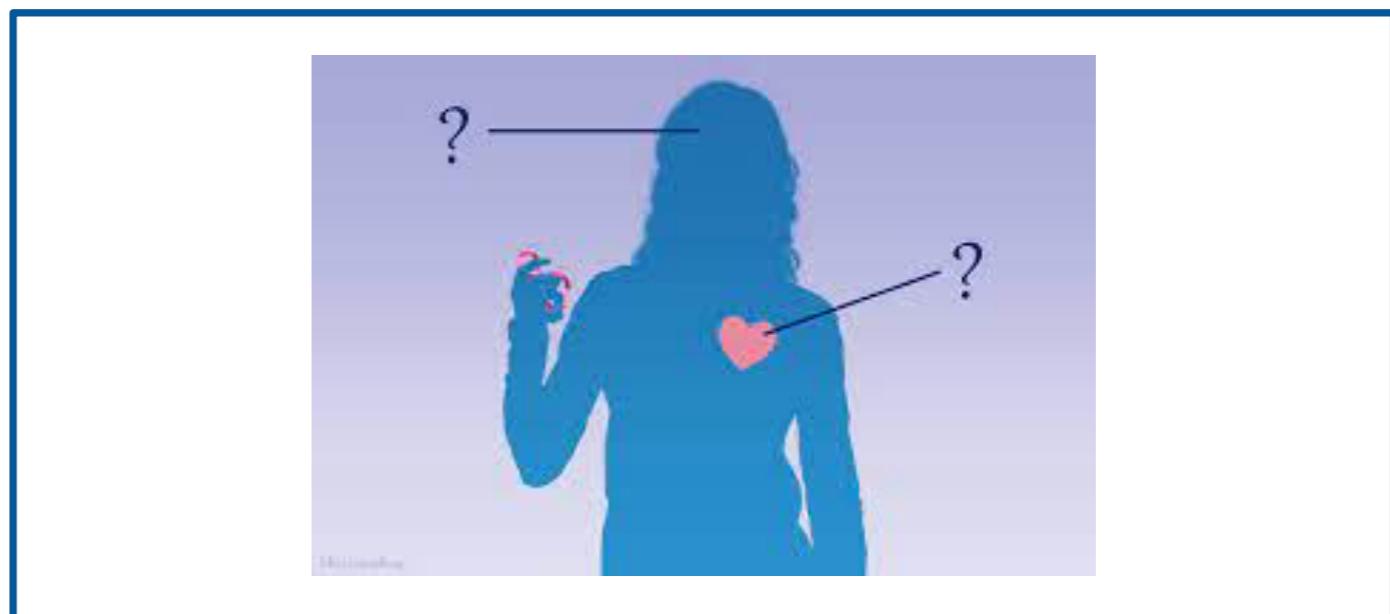

Johanson, D. L., Ahn, H. S., Goswami, R., Saegusa, K., & Broadbent, E. (in submission). The effects of robot empathy on trust and satisfaction in a healthcare scenario.

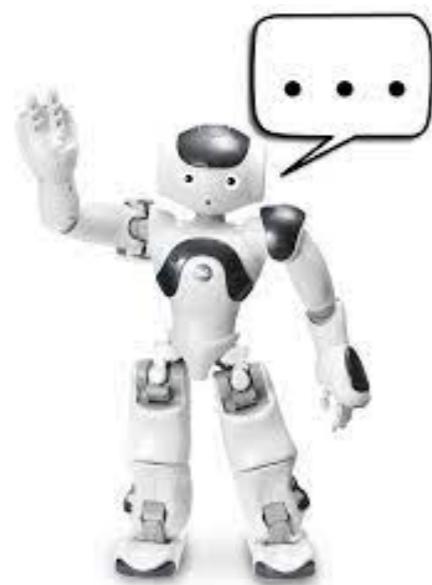

## Study 3- Method (N=100)

## Study 3 - Procedure

## Study 3 - Procedure

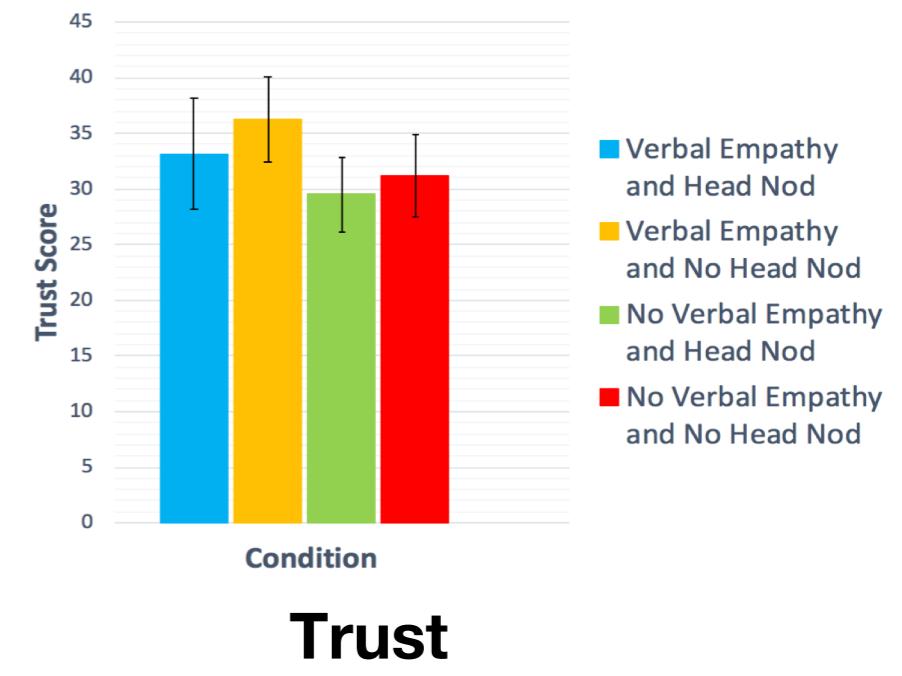

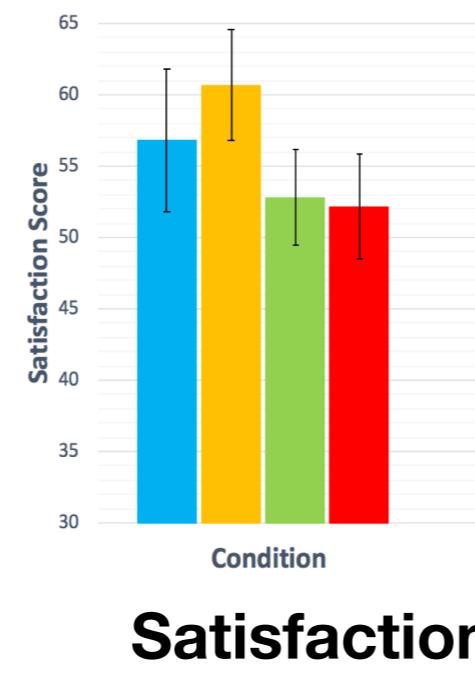

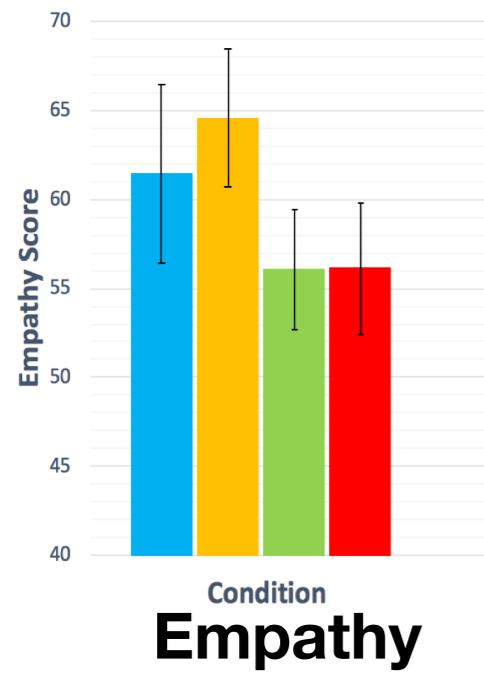

*“That sounds really hard. I can imagine that anyone in your situation would want to get some answers”*

*“A lot of patients experience fatigue and sleep issues”*

## Study 3- Key Findings

- Significant positive effects of verbal empathy on participant perceptions

- Robot Verbal empathy - Significantly lower levels of robot distrust
- No significant effect of head nodding on any outcome
- Potential explanation – not exaggerated enough for video format
- No significant interaction effects between head nodding and verbal empathy

# Thank you
